Since COVID-19 started, there have been a multitude of hypotheses and theories, trying to make sense of this and present potential solutions to what COVID actually is. Some ideas are wilder than others, while some alternative ideas make a lot of sense. This video is not going into what the so-called “virus” includes and does not include—that has been theorized elsewhere by many, and the results are often contradictory. However, we have quite a solid grasp of that COVID and the vaccines are steps toward the Singularity.

I will instead discuss what is actually happening in at least a fifth of patients who have had COVID, and this is taken from my own firsthand knowledge and existing statistics, so bear with me because this is very important for people who want to have a much greater chance to survive COVID:

There is no doubt in my mind that COVID is a bioweapon, intentionally spread among people, and regardless of what is being said, it's highly contagious. This, I have seen firsthand, and I can't unsee that, but what about the survival rate versus the death rate? After all, most people seem to survive COVID.

Well, those who die while having the full-blown symptoms often die because their immune systems is compromised, they have an underlying dis-ease, a physical weakness, or they are simply old.

However, there is another part of the population, who also dies, even though they were in excellent health before they got COVID.

I personally know of a few people who actually died from COVID, and who were unvaccinated. As mentioned earlier, COVID is highly contagious—I've seen this without any doubt. I agree with those who say it's not what science call a "virus," but it acts like a "virus" would act, according to how science defines the attributes of a virus.

The people I know of who died, and who were in excellent condition before COVID, lived through it, but afterwards, the D-dimer in their blood was all between 900-1500, whereas normal is below 500. Therefore, they were given blood thinners to prevent blood clots and/or to dissolve clots that had already formed somewhere in the body, but some still died from heart attacks within a few months after their COVID episode was over, due to blood clots, thinking they had recovered.

The D-dimer, showing the likelihood of blood clots in the bloodstream, are elevated in about 20% of those who have had COVID, according to statistics¹.

There are apparently those who survive and get their D-dimer down with blood-thinners, like aspirin, while others don't. When blood-thinners don't work, the patients get anticoagulation shots, which seem to have saved some people with high D-dimer. But, like I said, those I know of

¹ <https://www.bmj.com/content/377/bmj-2021-069590/rr-0#:~:text=In%20our%20experience%2C%20we%20observed,with%20prophylactic%20doses%20of%20enoxaparin>

firsthand were fairly young and very healthy, and they died unexpectedly.

Moreover, a good friend of mine has a friend who is a practicing medical doctor. One of my friend's friends just died from a heart attack caused by high D-dimer leading to a heart attack a few months after having had COVID, and when the doctor friend heard about that he said that in his profession he saw this all the time—many people die months after their COVID symptoms are gone.

So, I have a strong suggestion; if you have had COVID—even if it was a year ago, or more, go to a lab and get your D-Dimer checked. It may save your life. Most of the time, lives can apparently be saved for those with an elevated test result if they get the help they need, and sometimes, over-the-counter blood-thinner may or may not be enough.

In summary, the psychopaths squared 10, who run the show, have made sure to damn you if you don't take the vaccine, and damn you if you do—they can take out those they want to take out either way. The safest solution is, of course, not to get COVID, which seems like a strike of "luck," good protection, certain genetics, or perhaps any and all of it? Take care, people, because COVID needs to be taken seriously. It's time to come down to earth with this problem and stop denying it. It exists, it's killing us, it's deliberately planted, and it's highly infectious.
